

Research has shown that verbal adults with autism spectrum disorder and without co-occurring intellectual disability have difficulties with cognition.

Have you considered if your verbal ASD client:

- Processes information slowly?
- Struggles with understanding the main point when reading and conversing?
- Has difficulty attending to relevant information?
- Exhibits challenges with cognitive flexibility (e.g., difficulty shifting attention; being open to new ideas)?
- Has difficulty with working memory and problem solving?
- Seems to have trouble getting motivated?
- Struggles in school, or has difficulty getting or keeping a job?

What can be done to help?

We are raising awareness among practitioners in order to identify individuals who may benefit from resources and innovative treatment approaches that help with cognition.
